

# How Armored Carriers Are Saving Time and Money Using SafePak Deposit Retrieval Systems.

## Night Deposit Retrieval System

How the system works: A metal frame is mounted inside the night depository, directly under the drop chute. A SafePak collection bag slides into the frame and automatically locks into place. All deposits fall into the bag during the deposit period. To remove the bag, an armored carrier slides a special lid into a narrow slot at the top of the bag. The lid locks onto the bag automatically and then releases the bag from the frame. An empty bag slides into the frame (for the next deposit period) and the full bag is transported to the processing site. There is no deposit counting or manifesting and the entire procedure takes less than 30 seconds.

## SafePak Systems reduce costs, reduce risk and increase productivity!

- **Reduce Employee Costs.** Using SafePak systems, armored carriers can reduce three-man teams to two-man teams for single-custody deposit retrieval. A savings of more than 30% in employee wages and related costs can be achieved in many cases.
- **Reduce Time.** Time spent at the pick-up site (to retrieve deposits) and the processing site (to deliver deposits) is reduced to half a minute since there is no counting or manifesting of individual deposits (normally averaging 10-20 minutes at each location). Armored carriers also do not have to wait for bank personnel to arrive at the depository site to assist in collecting the deposits. More service stops can be made in less time...substantially increasing productivity.
- **Reduce Risk.** Reduced onsite time reduces the armored carrier's exposure to robbery. At branch locations, armored personnel can also enter during off-hours, taking advantage of low traffic times and less exposure to the general public.
- **Eliminate costly investigations.** No missing deposits mean no costly investigations. All deposits are secured inside the SafePak bag from the time they are deposited until they arrive at the processing site. Every bag is constantly monitored by the SafePak TamperCheck (electronic tamper-monitoring device) that alerts processing personnel of any unauthorized entry into the bag.
- **Advantage Over Competitors.** The combined benefits of the SafePak system enables the armored carrier to offer services at attractive rates...placing them in a distinct advantage over competing armored service providers.

## No Deposit Access. No Deposit Theft. SafePak Security!

## ATM Deposit Retrieval System

**How the system works:** A metal frame is mounted inside the ATM, directly under the depositor mechanism, replacing the standard open hard-shell plastic deposit bin. The bags are smaller, but the system functions just like the SafePak night deposit retrieval system described above....with some additional benefits.

**Reduce Servicing Costs:** By creating a single-custody daily deposit retrieval procedure\* and isolating it from the once-a-week cash replenishment procedure, the armored carrier can reduce servicing costs. Since there is no need to count or manifest deposit envelopes, much less time is spent at each ATM site. More ATMs can be serviced in less time with fewer personnel.

\*augmenting the SafePak system with the SafePak Cashbar, that blocks all access to cash cassettes except for cash replenishment personnel.
